Indiana Physician Survey, 2001

Executive Summary

The Indiana State Department of Health (ISDH) and the Indiana Health Professions Bureau (HPB) collaborated in implementing the 2001 Indiana Physician Survey. Voluntary surveys were attached to the 25,581 physician license renewals mailed in April 2001.

Of the physicians who were mailed license renewals and surveys, 89.7 percent (22,954) renewed their Indiana medical license. Of these physicians, 21,065 returned a survey with at least one response, for a response rate of 91.8 percent, an improvement over the 1997 response rate of 84.4 percent. Of the physicians responding to the survey, 9,984 had an active Indiana license, and were actively practicing medicine at an Indiana principal practice location. The data in the databook provide an aggregate portrait of these physicians.

Demographic and Professional Characteristics

- **Table II-A(2)** In 2001, about 20.9 percent of the active physician population in Indiana was female, compared to 17.4 percent in 1997. Male physicians comprised 79.1 percent of the active physician population in Indiana in 2001 and 82.6 percent in 1997.
- **Table II-A(3)-(4)** The ethnic and racial composition of Indiana physicians is changing. The number of physicians of Hispanic origin grew from 166 to 232 between 1997 and 2001, according to survey data. In 1997, 2.3 percent of Indiana physicians declared themselves of Hispanic origin, compared to 2.5 percent in 2001. In 2001, 79.8 percent of Indiana physicians were white, compared to 82.2 percent in 1997. Black/African American physicians comprised 3.7 percent (355) of Indiana physicians in 2001, compared to 2.9 percent (231) in 1997, over a 50 percent increase. The number and proportion of Asian/Pacific Islander physicians grew also, from 965 (12.2 percent) in 1997 to 1,187 (12.3 percent) in 2001. The proportion of American Indian/Native Alaskan physicians remained the same. Because the "Multi-racial" category was not present on the 1997 survey, no conclusion can be drawn about increases or decreases in the "Other" or "Multiracial" categories regarding 2001 survey data.
- **Table II-A(5)** In 2001, Indiana physicians appear to have a younger profile than in 1997, with physicians under 35 increasing by over 100 percent, from 389 (4.9 percent) to 830 (8.5 percent). Overall, in 2001, physicians under 55 comprised 76.3 percent of all physicians compared to 73.0 percent in 1997.
- **Table II-A(6)** Female physicians have increased in both number and proportion in every age category compared to 1997, but particularly among the younger age groups. For physicians under 55, females comprised 24.8 percent of physicians in 2001 compared to 21.4 percent in 1997.

Specialty Information

- **Table II-B(1)** Overall, Indiana physician numbers have grown by about 25 percent between 1997 and 2001. The survey indicates that growth has been significantly greater than this in some specialties, including critical care medicine, endocrinology, geriatrics, hematology, general internal medicine, internal medicine/pediatrics, neurology, pathology subspecialties, pediatric subspecialties, and radiology subspecialties. While some of the data may be influenced by differences in specialty classification between the 1997 and 2001 surveys, these increases, as well as slower growth or decreases in other specialties, may merit further research.
- **Table II-B(2)** Primary care physicians comprised 34.3 percent of all active Indiana physicians in 2001. Nationally, primary care physicians comprise 32.8 percent of all active physicians in 2001.¹ The number of primary care physicians in Indiana has grown by 30.4 percent since 1997.
- **Table II-B(3)** Overall population to primary care physician ratios in Indiana appear to have improved between 1997 and 2001 for both urban and rural populations, although the improvement may not have affected specific geographical areas of the state where physician shortage or maldistribution persist. It should be noted that while physician to population ratios are an important factor in assessing adequate access to care, other factors also significantly affect access, including insurance coverage, physician willingness to accept Medicare or Medicaid, and practice hours.
- **Chart and Table II-B(4)** While the 2001 statewide proportions of female and male physicians were 21.0 percent and 79.0 percent respectively, the female/male distribution within specialties may vary widely. Women may represent as much as 53.3 percent of a specialty, as in general pediatrics, or as little as 4-6 percent, as in urology, general surgery and surgical subspecialties. In family/general practice, the distribution of women and men is very close to the overall state percentage, with women representing 21.8 percent of the specialty and men representing 78.2 percent.
- **Table II-B(6)** Although male physicians comprise the majority of physicians in all aggregated specialty groups, a significantly higher proportion of female physicians practice in primary care than male physicians. Other specialties in which female physicians tend to practice in greater proportions include internal medicine/pediatrics, ob/gyn, pediatric subspecialties, psychiatry, pathology, and geriatrics.
- **Table II-B(7b)** While 34.3 percent of all physicians are in primary care (see **Table II-B(2)**), black/African American physicians and multi-racial physicians have a significantly higher proportion of physicians in primary care, 42.2 percent and 40.4 percent respectively. As

¹ American Medical Association (AMA), *Physician Characteristics and Distribution in the US, 2003-2004* (n.l., 2003), Table 4.1, p. 287. It should be noted that the AMA includes ob/gyn among the primary care specialties, although for purposes of this calculation, only family practice, general practice, general internal medicine and general pediatrics have been included.

Table II-B(8) indicates, the proportion of Hispanic physicians practicing primary care is about the same as the overall state proportion.

- **Table II-B(9)** Overall, about 23.7 percent of Indiana's physician population is 55 or older. In some aggregated specialty groups, this proportion is noticeably higher, including ob/gyn (26.5 percent), pathology (29.9 percent), psychiatry (33.0 percent), and surgery (28.8 percent).

Distribution Information

- **Table III-A(3a) and Table III-A(3b)** No matter which definition of rural is used (state or federal), survey data indicate that urban counties account for a preponderance of the physician population and have, overall, a better population to physician ratio (see also **Table II-B(3)**). As **Table III-A(3b)** illustrates, some specialties (including emergency medicine, family practice, general practice, general internal medicine, general pediatrics, ob/gyn and general surgery) account for significant proportions of the physicians located in rural counties, indicating a greater reliance on these specialties for care. Ensuring supply and distribution of these physicians, as well as access to specialized services, is important for rural Hoosiers.

Selected Physician Services Information

- **Chart III-B(1), Table III-B(1), Table III-B(2)** Approximately 14.3 percent of physician respondents statewide report activity in intensivist medicine, which involves the treatment and management of patients in an intensive care setting. The specialties with the highest proportions of physicians reporting activity in intensivist medicine are critical care medicine (93.1 percent) and pulmonary medicine (85.6 percent).
- **Table III-B(3)** Approximately 10.1 percent of physician respondents statewide report that they perform obstetrics. As **Chart III-B(3)** indicates, while a greater number of physicians in family practice/general practice report that they perform obstetrics (471) than do physicians in ob/gyn (443), a greater percentage of physicians in ob/gyn report that they perform obstetrics (88.1 percent) compared to physicians in family practice/general practice (24.5 percent).

Selected Patient Population Information

- **Table III-C(1)** Approximately 45.4 percent of physician respondents statewide report that children (≤ 18) are a significant part of their practice.
- **Table III-C(2)** Approximately 72.4 percent of physician respondents statewide report that the elderly (≥ 65) are a significant part of their practice.

Resident Physicians (Physicians in Training)²

- **Table IV-A(2)** About 32.6 percent of Indiana resident physicians are female. Male physicians comprise 67.4 percent of resident physicians.
- **Table IV-A(3)** Approximately 81.1 percent of Indiana resident physicians are white; 2.8 percent are black/African American; 12.3 percent are Asian/Pacific Islander; and 0.6 percent are multi-racial. Those selecting “Other” as their race comprise 3.3 percent.
- **Table IV-A(4)** Resident physicians of Hispanic origin make up about 2.8 percent of the resident physician pool.
- **Table IV-A(5)** In terms of specialty, 17.3 percent of Indiana resident physicians are in family practice/general practice, followed by 10.3 percent in general internal medicine, 7.4 percent in emergency medicine, and 6.7 percent in surgical subspecialties.

² These data encompass 557 resident physicians (physicians in training) who have a full Indiana medical license and an Indiana principal practice location. The data do not include resident physicians who have temporary permits.

Indiana Physician Survey, 2001

Chapter I

Survey Procedure, Response Rates and Derivation of the Analysis Pool

Survey Procedure

The Indiana State Department of Health (ISDH) and the Indiana Health Professions Bureau (HPB) collaborated in implementing the 2001 Indiana Physician Survey. Voluntary surveys were attached to the 25,581 physician license renewals mailed in April 2001. Physicians were asked to complete the half-page survey and return it with their license renewal.

All surveys received were electronically scanned and the data were programmed for purposes of statistical analysis. Guidelines were developed for the scanning and programming processes to assure as much as possible the consistency and comprehensiveness of the data. Every effort was made to reconcile any apparent anomalies, such as duplicate survey identifier numbers. In cases where physicians recorded two or more responses to single-response questions, criteria were developed to guide decision-making and to define usable information.

After survey data had been scanned and programmed, the survey data were linked to data from the HPB licensing database and then screened for current license status or any information that might indicate restricted practice activity. Using survey responses, physician data were also screened for active work status and physician training status. The survey data contained in Chapters 2-3 encompass only those physicians with a current Indiana license (expiration year 2003), whose practice license has no restrictions, who returned a survey with at least one response, and who did not report being retired or temporarily inactive. Resident physicians (physicians in training) have been separated out and given their own chapter (Chapter IV) in the databook.

Response Rates

Of the 25,581 physicians to whom a license renewal and a survey were mailed, 22,954 (89.7 percent) renewed their practice license (Chart I-A). Of the 22,954 physicians who renewed their license and received a voluntary survey, 21,065 returned a survey with at least one response on it; 1,393 did not return a survey; and 496 physicians returned a blank survey (Chart I-B), for a response rate of 91.8 percent. Table I-B shows the response rate by Indiana county or other location of mailing address.

Derivation of the Analysis Pool

Of the 21,065 physicians who responded to the survey, 20,331 (96.5 percent) had a non-restrictive license code status, and 734 had a license status code that indicated restricted practice (Chart I-C). These were removed from the analysis pool. Using Question 6 of the survey (See Appendix A), physicians were then screened for principal practice location zip code. Of the 20,331 physicians returning non-blank surveys who had no restrictive license status code, 18,365 (90.3 percent) provided usable principal practice location zip code information.

Of those providing usable principal practice location zip code information, 10,736 (58.5 percent) gave an Indiana zip code as their principal practice location (Chart I-D). When these physicians were screened for work status using survey information, a total of 9,984 were found to be actively practicing medicine in Indiana (Chart I-E). Of these physicians, 9,569 have a mailing address in Indiana, 333 have a mailing address in a Neighboring State (Illinois, Kentucky, Michigan or Ohio), and 82 have a mailing address in another location. Survey data related to these physicians were then analyzed using an outline developed with input from member of the Indiana Health Care Professional Development Commission.

Overview of the 2001 Indiana Physician Survey Databook

Between 1997 and 2001, the Indiana Health Professions Bureau was required to change the format for health professional license renewal. The new format dictated a shorter survey than was permitted in 1997. The Indiana Health Care Professional Development Commission revised survey content and format accordingly, trying to preserve as much as possible consistency of data elements. However, questions related to practice type, practice ownership, and practice site description had to be discarded. New questions related to services offered and populations treated were developed, and some of the demographic questions were modified to reflect Census 2000 terminology.

Each chapter of the Databook begins with a summary fact sheet with highlights from the tables and charts in the chapter.

- **Chapter II** contains information on the demographic and professional characteristics of physicians, including information on sex, race, ethnicity and specialty. The chapter also contains extensive information on activity levels of physicians (full-time and part-time) particularly as it relates to demographic and specialty characteristics.
- **Chapter III** contains information on physician distribution, services and patient population. Physician distribution is detailed by county of principal practice location, aggregated specialty group, and activity level. Counties are also profiled as to their projected loss or gain of primary care physicians between 1997 and 2001, based on survey data. The chapter also contains information on physicians who reported activity in intensivist medicine (see Terminology section below) and obstetrics, by specialty and county of principal practice location. Also included is information on statewide distribution of physicians who responded that children and/or the elderly were a significant part of the patient population. **Important note:** for purposes of the distribution tables, physicians have been allocated to the county of principal practice location, determined by the zip code reported on their survey. Physicians may have more than one practice location, however, and they may treat patients from multiple counties. The distribution data reported in this databook should not be interpreted as necessarily describing a physician's geographical practice area.
- **Chapter IV** profiles those resident physicians (physicians in training) who hold a full Indiana practice license. Resident physicians who hold only temporary medical permits for training purposes are not included in the chapter.

Terminology

- For many of the tables, the number of "Missing" responses are reported. "Missing" includes both unusable responses and blank responses to the question(s) from which the table was compiled. "Missing" responses have not been included in the calculation of percentages. In the case of some

county level tables, the total number of usable responses received was a more informative statistic, and this was used rather than the number missing.

- “MD” includes all allopathic physicians (Doctors of Medicine); “DO” includes all osteopathic physicians (Doctors of Osteopathic Medicine).
- “Primary Care” refers collectively to the specialties of family practice, general practice, general pediatrics and general internal medicine, as in the 1997 Indiana Physician Databook.
- “Intensivist medicine” is defined as patient care delivery and management in an intensive care setting.

Rural Classification Systems

Some of the physician distribution tables include columns that denote whether a county has been designated as a rural county based on federal criteria (“Fed. Rural”) or Indiana State Department of Health (ISDH) criteria (“IN Rural”). Based on the federal criteria, there are 55 rural counties in Indiana, encompassing 1,690,582 Hoosiers, or 27.8 percent of the population. By the ISDH criteria, there are 42 rural counties in the state, containing 921,116 people, or about 15 percent of the state’s population.

- **Federal Rural Classification Systems** The “Fed. Rural” designations are based on a comparison of the three urban/rural classification systems used by the federal government, which at this time designate the same 37 Indiana counties as urban and the same 55 Indiana counties as rural.

Some federal programs use Bureau of the Census (BOC) population density criteria as the determining factor for urban or rural status. Generally speaking, these criteria designate as urban any area that meets minimum population density requirements and encompasses at least 50,000 people; or an area that meets minimum population density requirements and has adjacent densely settled areas that contain between 2,500 people and 50,000 people. The full explanation of BOC criteria may be found in the Federal Register, Volume 67, #51, pp. 11663-11670. Some federal initiatives use these criteria with minor modifications to determine eligibility for such things as telecommunications discounts for rural health care providers, schools and libraries.

The federal Office of Management and Budget (OMB) also has criteria to define urban and rural. The OMB criteria state that in order to be called “urban” (or a “metropolitan statistical area”), a county must have a city with 50,000 or more inhabitants, or be an urbanized area as defined by the BOC with at least 50,000 inhabitants and a total metropolitan statistical area population of at least 100,000 (75,000 in New England). The metropolitan statistical area includes the county in which the central city is located and any other counties that are economically and socially integrated with the central county. OMB maintains a list of counties that are designated as urban. By default, those not classified as urban are rural. The Centers for Medicare and Medicaid Services use the OMB criteria for some of their programs.

The third set of federal criteria originates in the Department of Agriculture and utilizes a continuum approach to urban or rural designation. Counties are ranked on a scale of 1-9 with 1 being the most metropolitan and 9 being the most rural. These rankings are known as Rural to Urban Continuum Codes (RUCCs). Metropolitan counties are defined by population size and encompass rankings 1-3.

Non-metropolitan counties are defined by their degree of urbanization or proximity to metropolitan areas and encompass rankings 4-9. These RUCCs are used by the federal Office of Rural Health in their administration of certain rural funding programs, such as the Rural Health Outreach and Rural Network Development grants. It should be noted, however, that the federal Office of Rural Health allows certain metropolitan area zip codes to participate in these programs as well.

- **ISDH Rural Classification System** ISDH rural designation criteria are more restrictive than those used by the federal government. ISDH defines a rural county as one that has not been designated as a Metropolitan Statistical Area by the federal government and whose largest city has a population of less than 10,000. It should also be noted that in 1996, 44 counties fulfilled these criteria, while in 2001, 42 counties met the definition.

Indiana Physician Survey, 2001

2001 Physician Survey Procedure, Response Rates, and Derivation of the Analysis Pool

Chart I-A, 2001 Indiana Physician License Renewals

Of the 25,581 physicians to whom a license renewal and voluntary survey were mailed, 22,954 (89.7 percent) renewed their practice license.

Indiana Physician Survey, 2001

Survey Procedure, Response Rates, and Derivation of the Analysis Pool

Chart I-B, Physician Survey Response Rate

Of the 22,954 physicians who renewed their license and received a voluntary survey, 21,065 (91.8 percent) returned a survey with at least one response. Table I-B shows the survey return rate by mailing address (Indiana or other location).*

* Rounding may influence the calculation of total percent.

Chart I-C, License Status Profile

Physician surveys with at least one response were screened for any license status code that might interfere with practice (including inactive status). Of the 21,065 physicians responding to the survey, 20,331 (96.5 percent) had a non-restrictive license status code.

■ Non-restrictive License Status Code
▨ Other Code

Indiana Physician Survey, 2001

Survey Procedure, Response Rates, and Derivation of the Analysis Pool

Chart I-D, Physicians with an Indiana License, by State of Principal Practice Location

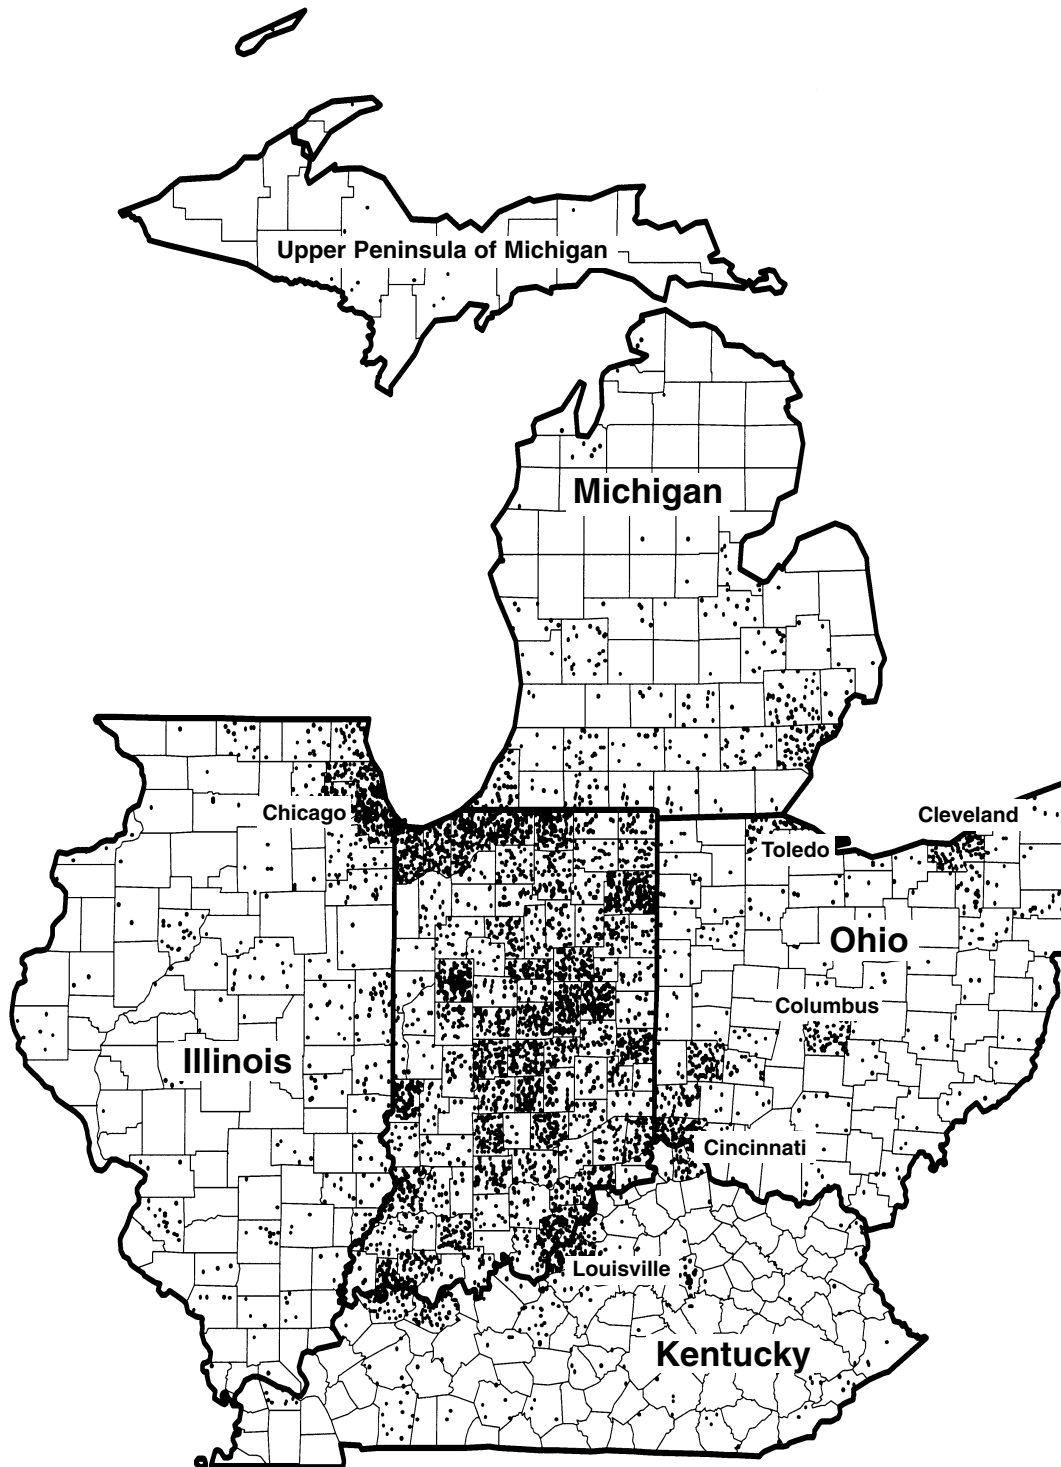

Using responses to Question 6 of the physician survey (see Appendix A), physicians with an active Indiana license were screened for practice location zip code. Of the 20,331 physicians returning non-blank surveys and who had no restrictive license status code, 18,365 had a usable practice location zip code. Only 1,966 physicians had no usable practice location zip code information.

* Neighboring States include Illinois, Kentucky, Michigan and Ohio.

Map I-D, Active Physicians with an Indiana License, by State and County of Principal Practice Location (Indiana and Neighboring States Only)*

* This dot density map depicts the relative density of physicians in a particular county, not the precise location of each physician. Physicians may have additional practice locations and/or may draw their patients from multiple counties.

Indiana Physician Survey, 2001

2001 Physician Survey Procedure, Response Rates, and Derivation of the Analysis Pool

Chart I-E, Physicians with an Active Indiana License and an Indiana Principal Practice Location, by Work Status

The 10,736 physicians with an Indiana principal practice location were screened for work status using Question 1 of the Indiana physician survey (see Appendix A). A total of 9,984 were found to be actively practicing medicine, including 204 who were missing responses to Question 1 but whose other survey responses indicated active work status. Only 8 physicians had no information indicating work status.

* Rounding may influence the calculation of total percent.

Chapter II

Active Physicians with an Indiana License and an Indiana Principal Practice Location

Demographic and Professional Characteristics

Summary Fact Sheet

The data in this chapter encompass 9,984 active physicians with an Indiana license and an Indiana principal practice location.

A. Demographic and Professional Characteristics

- **Table II-A(1)** Approximately 94.5 percent of the active physicians with an Indiana license and Indiana principal practice location are MDs and 5.5 percent are DOs. This represents only a slight change from the 1997 survey data, when 94.9 percent were MDs and 5.1 percent were DOs.
- **Table II-A(2)** In 2001, about 20.9 percent of the active physician population in Indiana was female, compared to 17.4 percent in 1997. Male physicians comprised 79.1 percent of the active physician population in Indiana in 2001 and 82.6 percent in 1997.
- **Table II-A(3)** The number of physicians of Hispanic origin grew from 166 to 232 between 1997 and 2001, according to survey data. In 1997, 2.3 percent of Indiana physicians declared themselves of Hispanic origin, compared to 2.5 percent in 2001.
- **Table II-A(4)** The racial composition of Indiana physicians is changing: in 2001, 79.8 percent of Indiana physicians were white, compared to 82.2 percent in 1997. Black/African American physicians comprised 3.7 percent (355) of Indiana physicians in 2001, compared to 2.9 percent (231) in 1997, over a 50 percent increase. The number and proportion of Asian/Pacific Islander physicians grew also, from 965 (12.2 percent) in 1997 to 1,187 (12.3 percent) in 2001. The proportion of American Indian/Native Alaskan physicians remained the same. Because the "Multi-racial" category was not present on the 1997 survey, no conclusion can be drawn about increases or decreases in the "Other" or "Multiracial" categories regarding 2001 survey data.
- **Table II-A(5)** In 2001, Indiana physicians appear to have a younger profile than in 1997, with physicians under 35 increasing by over 100 percent, from 389 (4.9 percent) to 830 (8.5 percent). Overall, in 2001, physicians under 55 comprised 76.3 percent of all physicians compared to 73.0 percent in 1997.
- **Table II-A(6)** Female physicians have increased in both number and proportion in every age category compared to 1997, but particularly among the younger age groups. For

physicians under 55, females comprised 24.8 percent of physicians in 2001 compared to 21.4 percent in 1997.

B. Specialty Information

- **Table II-B(1)** Overall, Indiana physician numbers have grown by about 25 percent between 1997 and 2001. The survey indicates that growth has been significantly greater than this in some specialties, including critical care medicine, endocrinology, geriatrics, hematology, general internal medicine, internal medicine/pediatrics, neurology, pathology subspecialties, pediatric subspecialties, and radiology subspecialties. While some of the data may be influenced by differences in specialty classification between the 1997 and 2001 surveys, these increases, as well as slower growth or decreases in other specialties, may merit further research.
- **Table II-B(2)** Primary care physicians comprised 34.3 percent of all active Indiana physicians in 2001. Nationally, primary care physicians comprise 32.8 percent of all active physicians in 2001.¹ The number of primary care physicians in Indiana has grown by 30.4 percent since 1997.
- **Table II-B(3)** Overall population to primary care physician ratios in Indiana appear to have improved between 1997 and 2001 for both urban and rural populations, although the improvement may not have affected specific geographical areas of the state where physician shortage or maldistribution persist. It should be noted that while physician to population ratios are an important factor in assessing adequate access to care, other factors also significantly affect access, including insurance coverage, physician willingness to accept Medicare or Medicaid, and practice hours.
- **Chart and Table II-B(4)** While the 2001 statewide proportions of female and male physicians were 21.0 percent and 79.0 percent respectively, the female/male distribution within specialties may vary widely. Women may represent as much as 53.3 percent of a specialty, as in general pediatrics, or as little as 4-6 percent, as in urology, general surgery and surgical subspecialties. In family/general practice, the distribution of women and men is very close to the overall state percentage, with women representing 21.8 percent of the specialty and men representing 78.2 percent.
- **Table II-B(5)** While the majority of physicians statewide and in all aggregated specialty groups are MDs as opposed to DOs, a higher proportion of DOs tend to practice in primary care and emergency medicine compared to MDs.
- **Table II-B(6)** Although male physicians comprise the majority of physicians in all aggregated specialty groups, a significantly higher proportion of female physicians practice in primary care than male physicians. Other specialties in which female physicians tend to

¹ American Medical Association (AMA), *Physician Characteristics and Distribution in the US, 2003-2004* (n.l., 2003), Table 4.1, p. 287. It should be noted that the AMA includes ob/gyn among the primary care specialties, although for purposes of this calculation, only family practice, general practice, general internal medicine and general pediatrics have been included.

practice in greater proportions include internal medicine/pediatrics, ob/gyn, pediatric subspecialties, psychiatry, pathology, and geriatrics.

- **Table II-B(7a)** As in the general population, the white physician population predominates in the profession, although physicians of other races are represented in all specialties.
- **Table II-B(7b)** While 34.3 percent of all physicians are in primary care (see **Table II-B(2)**), black/African American physicians and multi-racial physicians have a significantly higher proportion of physicians in primary care, 42.2 percent and 40.4 percent respectively. As **Table II-B(8)** indicates, the proportion of Hispanic physicians practicing primary care is about the same as the overall state proportion.
- **Table II-B(9)** Overall, about 23.7 percent of Indiana's physician population is 55 or older. In some aggregated specialty groups, this proportion is noticeably higher, including ob/gyn (26.5 percent), pathology (29.9 percent), psychiatry (33.0 percent), and surgery (28.8 percent).

C. Activity Level Information

- **Chart II-C(1) and Table II-C(1)** Greater proportions of female physicians than male physicians work part-time in all activities in medicine, regardless of age group. Survey data also indicate that 73.9 percent of all female physicians work full-time in all activities in medicine, compared to 87.3 percent of male physicians. However, female physicians who work part-time often work more hours per week than male physicians in the same specialty. Examples include allergy and immunology, anesthesiology, emergency medicine, endocrinology, family practice/general practice, infectious disease, general internal medicine, internal medicine/pediatrics, oncology, general pathology, pathology subspecialties, pediatrics subspecialties, general radiology, radiology subspecialties and radiation oncology.

Chapter III

Active Physicians with an Indiana License and an Indiana Principal Practice Location

Distribution, Services and Patient Population Information

Summary Fact Sheet

The data in this chapter encompass 9,984 active physicians with an Indiana license and an Indiana principal practice location.

A. Distribution Information

- **Table III-A(1)** This table describes physician distribution by county and aggregated specialty group, similar to a table included in the 1997 databook. This information is supplemented by **Table III-A(2)**, which contains average hours per week by selected aggregated specialty group for the calculation of physician FTEs for counties. It should be noted, however, that physicians may have additional practice locations and/or draw their patients from multiple counties.
- **Table III-A(3a) and Table III-A(3b)** No matter which definition of rural is used (state or federal), survey data indicate that urban counties account for a preponderance of the physician population and have, overall, a better population to physician ratio (see also **Table II-B(3)**). As **Table III-A(3b)** illustrates, some specialties (including emergency medicine, family practice, general practice, general internal medicine, general pediatrics, ob/gyn and general surgery) account for significant proportions of the physicians located in rural counties, indicating a greater reliance on these specialties for care. Ensuring supply and distribution of these physicians, as well as access to specialized services, is important for rural Hoosiers.

B. Selected Physician Services Information

- **Chart and Table III-B(1)** Intensivist medicine is the treatment and management of patients in an intensive care setting. While a number of specialties seem to have physicians who report activity in intensivist medicine, the specialties with the highest proportions of physicians reporting activity in intensivist medicine are critical care medicine (93.1 percent) and pulmonary medicine (85.6 percent). Cardiology (47.0 percent), pediatric subspecialties (33.9 percent), internal medicine/pediatrics (29.9 percent) and general internal medicine (29.2 percent) have substantial proportions of physicians reporting intensivist activity as well.
- **Table III-B(2)** Approximately 14.3 percent of physician respondents statewide report activity in intensivist medicine.

- **Table III-B(3)** Approximately 10.1 percent of physician respondents statewide report that they perform obstetrics. As **Chart III-B(3)** indicates, while a greater number of physicians in family practice/general practice report that they perform obstetrics (471) than do physicians in ob/gyn (443), a greater percentage of physicians in ob/gyn report that they perform obstetrics (88.1 percent) than physicians in family practice/general practice (24.5 percent).

C. Selected Patient Population Information

- **Table III-C(1)** Approximately 45.4 percent of physician respondents statewide report that children (≤ 18) are a significant part of their practice.
- **Table III-C(2)** Approximately 72.4 percent of physician respondents statewide report that the elderly (≥ 65) are a significant part of their practice.

Indiana Physician Survey, 2001

Map III-B(3c), Counties with Active Ob/Gyns and Other Active Physicians Who Perform Obstetrics, Based on Principal Practice Zip Code*

* This map portrays the practice location zip code of obstetricians and other physicians whose survey responses indicated that they perform obstetrics. While there may be only one symbol in a county, there may be more than one physician in the same zip code who performs obstetrics. See Table III-B(3) for the number and speciality of physicians performing obstetrics by county of principal practice location.

Chapter IV

Resident Physicians with an Indiana License and an Indiana Principal Practice Location

Summary Fact Sheet

The data in this chapter encompass 557 resident physicians (physicians in training) with a full Indiana medical license and an Indiana principal practice location.

- **Table IV-A(1)** Approximately 94.4 percent of the resident physicians with an Indiana license and Indiana principal practice location are MDs and 5.6 percent are DOs.
- **Table IV-A(2)** About 32.6 percent of Indiana resident physicians are female. Male physicians comprise 67.4 percent of resident physicians.
- **Table IV-A(3)** Approximately 81.1 percent of Indiana resident physicians are white; 2.8 percent are black/African American; 12.3 percent are Asian/Pacific Islander; and 0.6 percent are multi-racial. Those selecting "Other" as their race comprise 3.3 percent.
- **Table IV-A(4)** Resident physicians of Hispanic origin make up about 2.8 percent of the resident physician pool.
- **Table IV-A(5)** In terms of specialty, 17.3 percent of Indiana resident physicians are in family practice/general practice, followed by 10.3 percent in general internal medicine, 7.4 percent in emergency medicine, and 6.7 percent in surgical subspecialties.
